## **Supplementary Information**

## 1. Nomenclature

**Parameters: Symbol – Description – Units** 

Process		
$R_0$	Needle tip radius	mm
Z	Needle tip to collector distance	mm
t	Time	S
p	Pressure	kPa
Q	Volumetric flowrate	$m^3/s$
$V_p$	Voltage applied to needle tip	kV
$V_c$	Voltage applied to collector	kV
$T_n$	Needle temperature	°C
$T_c$	Collector temperature	°C
$U_c$	Collector speed	$mm\ s^{-1}$
$U_{cr}$	Critical collector speed	$mm\ s^{-1}$
Jet		
R	Jet radius	mm
$V_{j}$	Jet speed in y axis	$mm\ s^{-1}$
$U_{j}$	Jet speed in x axis	$mm\ s^{-1}$
$V_{jm}$	Jet speed on impact point	$mm \ s^{-1}$
$ heta_{jl}$	Angle left	(°)
$ heta_{jr}$	Angle right	(°)
$A_{i}$	Area	$mm^2$
$L_i$	Lag distance	mm
Physics Jet Mod	_	
Re	Reynolds number	_
Pe	Peclet number	<del>_</del>
Са	Capillary number	<del>-</del>
Fe	Electrostatic force parameter	<del>-</del>
Bo	Bond number	_
Na	Nahme-Griffith number	_
De	Deborah number	_
$Bi_L$	Local Biot number	_
$\Theta$	Dimensionless temperature	_
$\Gamma$	Temperature factor	_
χ	Aspect ratio	_
$\alpha$	Mobility factor	_
β	Ratio of solvent to zero-shear-rate	_
	viscosity	
$eta_E$	Dielectric constant ratio	_
σ	Surface charge density	$C/m^2$

$E_T$	The tangential component of the electric	V/m
	field to the jet surface	
$f(\theta)$	Temperature dependence of the zero-	<del>-</del>
	shear-rate viscosity	
$\Delta H$	Activation energy	K
$R_{ig}$	Ideal gas constant	<del>-</del>
$\Delta T_{Rh}$	Temperature change necessary to	K
	substantially alter the rheological	
	properties of the fluid	_
$ au_{zz}$	Total axial normal stress	Pa
$ au_{rr}$	Total radial normal stress	Pa
$ au_{p,zz}$	Axial polymeric stress	Pa
$ au_{p,rr}$	Radial polymeric stress	Ра
Geometrical model		
$R_c$	Steady coiling radius	mm
q	Jet's trace on the collector	mm
r	The contact point	mm
S	Deposited jet's arc length	mm
r	Polar radius coordinate	mm
$\psi$	Polar angle coordinate	(°)
heta	Curvature at the bottom of the jet	(°)
CV Metrology		
$t_{CV}$	Processing time	S
fps	Frames per second	$s^{-1}$
_	( \ - 1 \ \ \ \ \ \ \ - 4 \ \ \ \ \ \ \ \ \ \ \	/i
cf	Calibration factor	mm/pix
cf stride	Indicating every how many pixels along	mm/pix pix
stride		, <u>-</u>
stride Gaussian Processes	Indicating every how many pixels along the z-axis we perform computations	, <u>-</u>

Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$ $\theta$ $\mu(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained Mean prediction of GP model	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$ $\theta$ $\mu(\cdot)$ $\sigma^2(\cdot)$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained Mean prediction of GP model Variance prediction of GP model	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$ $\theta$ $\mu(\cdot)$ $\sigma^2(\cdot)$ $n$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained Mean prediction of GP model Variance prediction of GP model Number of available data	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$ $\theta$ $\mu(\cdot)$ $\sigma^2(\cdot)$ $n$ Multifidelity Modeli	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained Mean prediction of GP model Variance prediction of GP model Number of available data	, <u>-</u>
Stride  Gaussian Processes $D$ $f(\cdot)$ $m(\cdot)$ $K(\cdot)$ $k(\cdot)$ $\theta$ $\mu(\cdot)$ $\sigma^2(\cdot)$ $n$	Indicating every how many pixels along the z-axis we perform computations  Dataset, available input-output pair of observation data Unknown function to be approximated Mean function determining the unknown function Covariance matrix determining the unknown function Kernel reflecting the prior available knowledge on the unknown function Kernels hyperparameters to be trained Mean prediction of GP model Variance prediction of GP model Number of available data	, <u>-</u>

$ ho$ $f_{err}(\cdot)$	A scaling constant quantifying the correlation between the two models Another GP modeling the bias term for the high-fidelity data	_		
$n_{low}$	Number of low-fidelity data available	_		
$n_{high}$	Number of high-fidelity data available	_		
Active Learning and Bayesian Optimization				
$u(\cdot)$	Acquisition function	_		
ξ	Parameter specifying the least required improvement	_		
$\Phi(\cdot)$	The normal cumulative distribution function	_		
$\phi(\cdot)$	The normal probability distribution function	_		
κ	Parameter specifying reliability of confidence intervals	_		
Performance Metrics				
RMSE	The Root Mean Squared Error Performance Metric measures the average magnitude of the error between the predicted values and the true values.	-		
MCIW	The Mean Confidence Interval Width Performance Metric measures the average width of a confidence interval.	-		
Min. Regret	The Minimum Regret Performance Metric quantifies how well a method works at finding the optimum.	-		

## 2. Dataset

Video S1 and Video S2 published by Hrynevich et al. <sup>10</sup> were chosen as the source of the dataset used in this paper. A Sony Alpha 7 (Sony Corp. Japan) digital camera was used with a Nikon ED 200 mm lens (Nikon Corp. Japan). 1080 p resolution videos of the nozzle, jet and collector were taken at 50 frames per second. Process hyperparameters were set to 8 m s<sup>-2</sup> and 500 m s<sup>-3</sup> maximal stage acceleration and jerk, a 22G nozzle was used, polymer temperature was set to 87 °C and the voltage to the collector was set to -1.5kV, while the voltage to the nozzle was set to +5.75kV.

For Video S1 the air pressure feeding the nozzle was set to 1.2 bar and the distance between nozzle and collector was set to 3.5mm with a standard deviation 0.1mm. Collector's speeds tested in Video S1 were 191.25 mm  $\rm s^{-1}$ , 212.5 mm  $\rm s^{-1}$ , 255 mm  $\rm s^{-1}$ , 340 mm  $\rm s^{-1}$ , 510 mm  $\rm s^{-1}$ , 850 mm  $\rm s^{-1}$ , 1530 mm  $\rm s^{-1}$  and 2890 mm  $\rm s^{-1}$ .

For Video S2 the air pressure feeding the nozzle was set to 2.4 bar and the distance between nozzle and collector was set to 4.5mm with a standard deviation 0.1mm. Collector's speeds tested in Video S2 were 292.5 mm s<sup>-1</sup>, 520 mm s<sup>-1</sup>, 1300 mm s<sup>-1</sup> and 4420 mm s<sup>-1</sup>.

First, the videos were split based on the collector speed setting. Second, the video frames were cropped to remove redundant pixels that would result to increased processing time. For real time video processing the user would need to specify the region of interest in the frame, so as to crop and dispose needless information, as well as the position of the nozzle, the collector, and a factor, which represents the length of the Taylor cone depending on the nozzle's diameter.

## 3. Supporting Figures

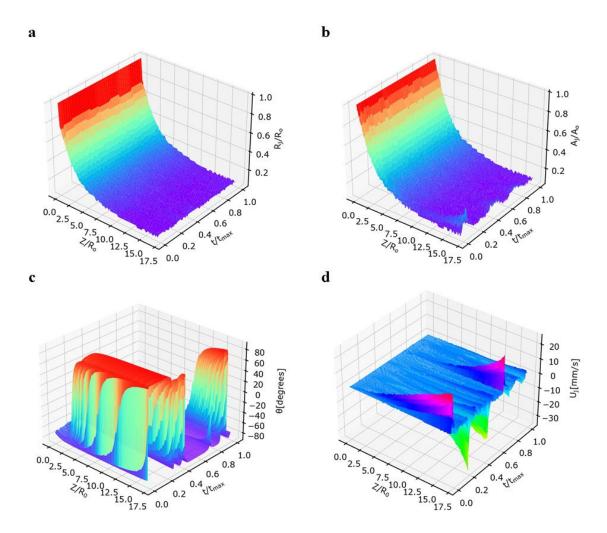

Figure 1: Features Extracted from Computer Vision Module. a) Normalized jet radius  $(R_j/R_o)$  obtained from the computer vision metrology module of the GPJet framework plotted against the normalized jet length  $(Z/R_o)$  and the normalized time  $(t/t_{max})$ . b) Normalized jet area  $(A_j/A_o)$  obtained from the computer vision metrology module of the GPJet framework plotted against the normalized jet length  $(Z/R_o)$  and the normalized time  $(t/t_{max})$ . c) Jet angles  $(\theta)$  obtained from the computer vision metrology module of the GPJet framework plotted against the normalized jet length  $(Z/R_o)$  and the normalized time  $(t/t_{max})$ . d) Jet velocities  $(U_j)$  obtained from the computer vision metrology module of the GPJet framework plotted against the normalized jet length  $(Z/R_o)$  and the normalized time  $(t/t_{max})$ .

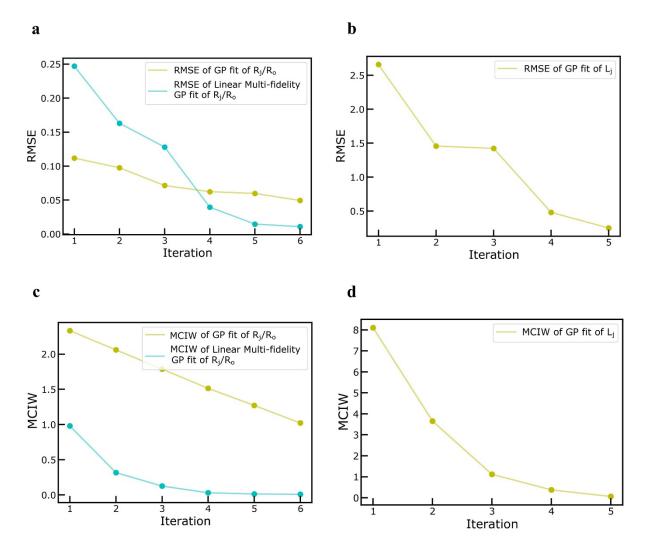

Figure 2: Performance Metrics Evolution for Active Learning Tasks. a) Root Mean Squared Error (RMSE) evolution after each iteration, regarding the normalized jet radius  $(R_j/R_o)$ . b) Root Mean Squared Error (RMSE) evolution after each iteration, regarding the lag distance  $(L_j)$ . c) Mean Confidence Interval Width (MCIW) evolution after each iteration, regarding the normalized jet radius  $(R_j/R_o)$ . d) Mean Confidence Interval Width (MCIW) evolution after each iteration, regarding the lag distance  $(L_j)$ .

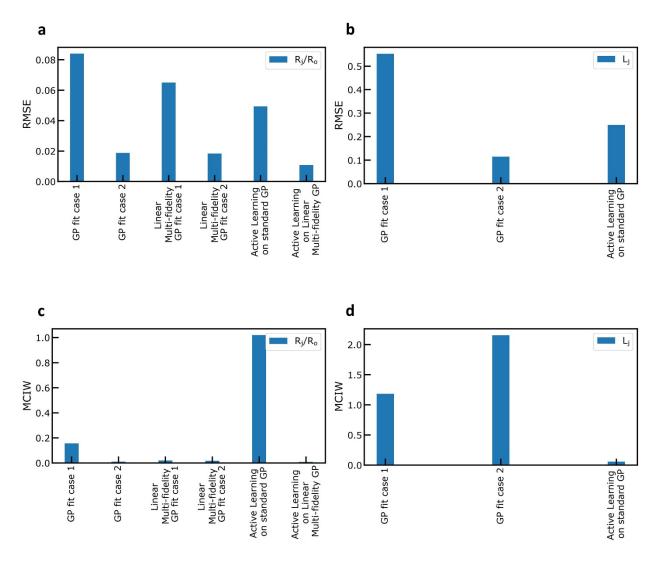

Figure 3: Collective Performance Metrics for Regression and Active Learning Tasks. a) Root Mean Squared Error (RMSE) for every case, regarding the normalized jet radius  $(R_j/R_o)$ . b) Root Mean Squared Error (RMSE) performance metric, for every case, regarding the lag distance  $L_j$ . c) Mean Confidence Interval Width (MCIW) performance metric, for every case, regarding the normalized jet radius  $(R_j/R_o)$ . d) Mean Confidence Interval Width (MCIW) performance metric, for every case, regarding the lag distance  $(L_i)$ .

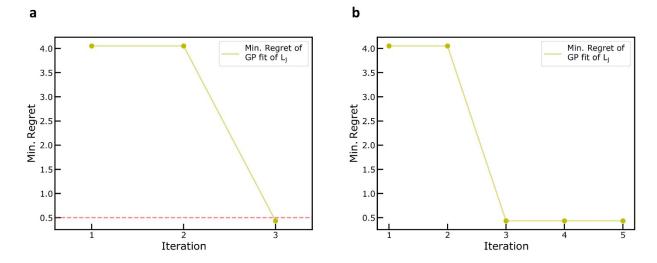

Figure 4: Performance Metrics. a) Minimum Regret Performance Metric evolution, after each iteration, regarding the Bayesian Optimization Task to find the minimum lag-distance  $(L_j)$ . b) Minimum Regret Performance Metric evolution, after each iteration, regarding the Active Learning Task to explore the design space of lag-distance  $(L_j)$  for specific speed ratios  $(U_c/V_{jm})$ .
